

# Product Sheet: Flow Release Tool (FRT)

## Product Description

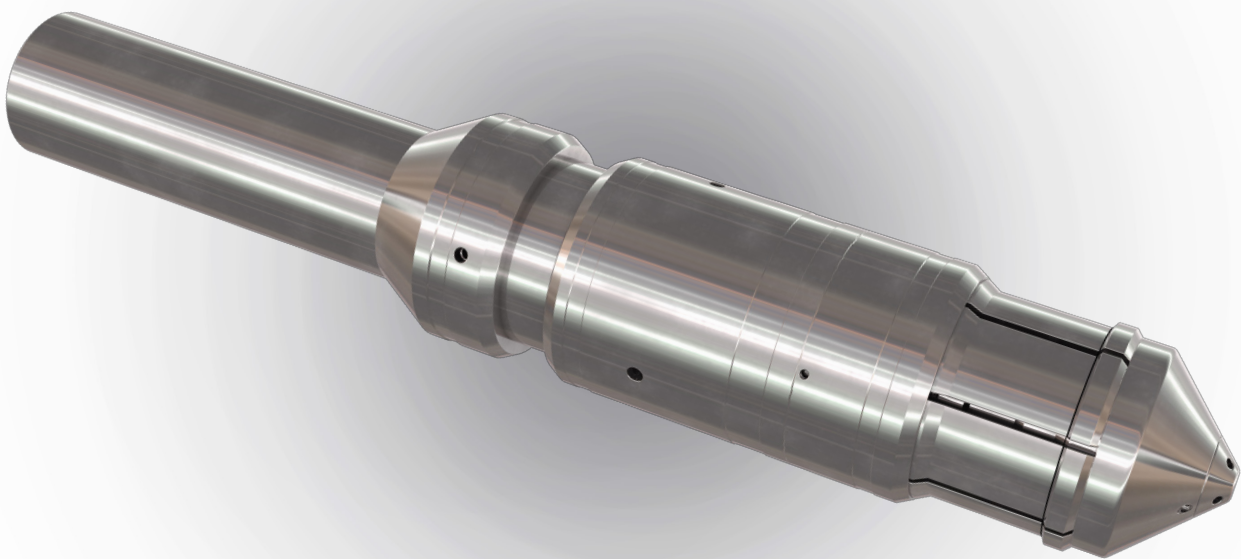

The Flow Release Tool (FRT) is a running and pulling tool designed to fit the industry's standard GS style fish necks. The tool is a pipe and coil tubing service tool, designed to retrieve Bridge Plugs, Packers, Straddles and other intervention devices from the well bore by engaging an internal type GS fishing neck. Its high strength design ensures both compatibility with the running string, and the heavy pulling and jarring forces expected during difficult pulling jobs.

## Product Application

The flow release feature eliminates the chance of accidental tool release when engaging the fish neck, which is often experienced when trying to use wireline type GS tools on pipe and coil tubing. The appropriate orifice is selected depending on each operation's pumping capabilities and requirements. It is easily installed and tested at the surface prior to being run.

## Product Benefits:

The Flow Release Tool (FRT) retrieves various intervention devices. Furthermore, the FRT eliminates the chance of accidental tool release.

# Product Sheet: Flow Release Tool (FRT)

## Product Features

- Standard GS style Fish Neck
- High strength design
- Eliminates chance of accidental tool release
