

# REDUCE RIG TIME WITH **DEEP-SET HEX**

Interwell's solution for a deepwater well in the Gulf of Mexico saved the client over \$500k in rig time.

The client required a Retrieval Bridge Plug to enable integrity testing in their challenging well which contained lots of debris and potential for getting stuck. Interwell ran and set a 180-350 High Expansion (HEX) Mechanical and Retrieval Bridge Plug, and successfully retrieved the plug in 12 hours with slickline, saving valuable rig time.

“

*This [plug retrieval] was highlighted as one of the highest risk points of the operation. Mechanical failures, delivery issues, solids, pressure etc., all could have created situations difficult to recover from in the wellbore. Recovering the plug gets the operations past a major hurdle.”*
