

Expandable Junk Catcher (EJC)

Description

The EJC is a stand-alone tool designed to safely collect any debris within the wellbore. Since it runs independently, it can be placed at the location of choice without relying on a dedicated landing profile. The innovative swap cup provides a funnel towards the casing and guides any debris inside the basket; preventing debris from falling into the anchoring module of the EJC or other equipment installed below. It's set with a standard setting tool, and is designed with a GS style fish neck for retrieval from the wellbore.

Application

The EJC provides a safe solution to effectively collect debris within the wellbore. Not only can it be used as a debris catcher with our range of retrievable bridge plugs, but it can be utilized as a stand-alone tool for gas-lift change out operations.

Expandable Junk Catcher (EJC)

Benefits

- Can be run on Wire Line.
- Set and retrieve in one run.
- Additional baskets can be incorporated as required.
- Retrieve with standard GS with DU and dedicated prong.
- Innovative swab-cup effectively funnels debris into the catcher.
- Other sizes available upon request.
- High performance anchoring module.
